

Selecting the 9 wire emulation on the Documax 5380

There are two ways to change the 24/9 wire emulation mode setting on the 5380.

1. Use the driver

To do this you will need to connect the PC to the printer and make sure the printer is in Online mode. Then go to the printer driver on the PC, go to the printer properties and then the printer settings. The 9/24 wire emulation setting is called Line Unit. You will want to change this to 1/216 for 9 wire emulation or 1/180 for 24 wire emulation.

2. Use the printer menu

To do this you will need to load a sheet of paper, then press and hold the LOAD/EJECT key and then press the ONLINE key. Hold both keys for 3 seconds. The menu setting will begin to print. To move the head to the next menu press the LOAD/EJECT key and then press the LF/FF key to choose the menu you are currently on. The Line Unit setting is in the Print Setup menu. Set this to 1/216 for 9 wire emulation or 1/180 for 24 wire emulation. Once you have made your selection, press and hold the online button until the printer stops printing. Then you can power cycle the printer and it will be in the 9/24 wire emulation you choose.
